Maintaining Web Content on Chain Reaction Web

1. To upload content for your web site, you will need access to an ftp program. You can use the basic ftp program supplied with Windows, or a commercial program such as [WS_FTP](#).
2. Instruct your ftp program to connect to your site. Use your main domain name as the ftp site name. For example, if your domain name is [test.com](#), tell your ftp program to connect to site [test.com](#).
3. Enter your assigned site user name and password at the prompts..
4. Instruct your ftp program to change directories to your content directory. For domain [test.com](#), your directory name would be:

[\www\test.com](#)
5. Use your ftp program to upload your files to the directory. You may create and upload subdirectories, such as *images*, to help keep your content files organized.
6. Each time you need to change your content, use your ftp program as above to copy the new or modified files to your site directory..
